

Review on the Konstanta Soot Use - KIPR

The main activity of KIPR LLC is a production of mechanical rubber goods, rubber mixtures and reclaimed rubber for different purposes and utilization of scrap tires and oils.

Our company uses Konstanta industrial soot as well as test samples of the same product provided by Jelezno LLC.

During the production process it was stated that Konstanta industrial soot has no irrelevant inclusions, presence of grit and scale. The run of the relative specific surface is non-essential, PH corresponds to the requirements. Flexibility of rubber mixture produced with application of Konstanta industrial soot during the working shift is stable.

Tested soot is homogenous, its relative specific surface corresponds to carbon black P-803, tar characteristics are noticeably reduced.

Konstanta industrial soot can be used in production of low-duty rubber of general application.
